

Getting the best from Acelepryn

YOUR 7 POINT PLAN FOR APPLICATION ON GOLF COURSES AND RACE TRACKS

1
Apply preventatively.

2
Apply to the turf during the period when peak numbers of target species are observed.

3
Mow prior to application.

4
Apply at 0.6l/ha, in a minimum of 600 litres of water, using a Syngenta XC or suitable air induction 08 nozzle between 2 – 4 bar pressure.

5
Where ever possible irrigate in with 3-6 mm water after application, avoiding run-off. If irrigation is not possible then natural rainfall will be required to move the product down through the organic matter layer.

6
Apply in tank mix or sequence with a wetting agent where significant organic matter is present or if there are hydrophobic areas. Syngenta wetting agent Qualibra is compatible with Acelepryn.

7
Delay mowing after application until irrigation has taken place or rainfall has occurred and / or return clippings.
